3-O-HETEROARYL-INGENOL**CROSS REFERENCE TO RELATED APPLICATIONS**

This application is the National Phase of PCT International Application No. PCT/EP2013/062995, filed on Jun. 21, 2013, which claims priority under 35 U.S.C. 119(e) to U.S. Provisional Application Nos. 61/664,398 and 61/763,206, filed on Jun. 26, 2012 and Feb. 11, 2013 respectively, all of which are hereby expressly incorporated by reference into the present application.

FIELD OF THE INVENTION

This invention relates to novel derivatives of 3-O-heteroaryl-ingenol, to intermediates for the preparation thereof, to said compounds for use in therapy, to pharmaceutical compositions comprising said compounds, to methods of treating diseases with said compounds, and to the use of said compounds in the manufacture of medicaments.

BACKGROUND OF THE INVENTION

Ingenol-3-angelate (PEP005, ingenol mebutate, Picato®) is a diterpene-ester of the ingenol family which is isolated from various *Euphorbia* species, particularly from *Euphorbia peplus*. The compound has been launched for the treatment of actinic keratosis and is presently subject for clinical development for non-melanoma skin cancer.

WO99/08994 describes isolation of compounds from *Euphorbia* plant and their use in cancer and other neoplastic diseases hereunder actinic keratosis or solar keratosis.

WO 2012/085189, WO 2012/083954 and WO 2012/083953 describe ingenol-3-acylates and ingenol-3-carbamates which stimulate neutrophil oxidative burst, stimulate keratinocyte IL-8 release or which induce rapid necrosis.

Sorg et. al. *Z Naturforsch.* 37b, 1640-7 (1982) has described 3-O-(2-methoxyethoxy)methyl-ingenol as an intermediate in the preparation of ingenol derivatives.

Ingenol-3-angelate is believed to have a dual mode of action: 1) Induction of cell death by direct cytotoxicity or induction of apoptosis and 2) an immunostimulatory effect dominated by neutrophil recruitment and activation (Rosen, R. H., et al., *J Am Acad Derm* (2012), 66, 486-493; Ersvaer, E., et al., *Toxins*, (2010), 2, 174-194). Nanomolar concentrations of the agent cause activation and modulation of protein kinase C (PKC) classical and novel isoforms, with particular importance of PKCdelta. Through activation of PKCdelta the agent induces apoptosis in susceptible cells (Hampson, P., et al., *Blood*, (2005), 106, 1362-1368; Cozzi, S. J., et al., *Cancer Res*, (2006), 66, 10083-10091). Rapid cytotoxicity on cancer cells is observed at high micromolar concentrations (Ogbourne, S. M., et al., *Cancer Res* (2004), 64, 2833-2839). Through activation of various PKC isoforms the agent also induces pro-inflammatory effects, including release of pro-inflammatory mediators (Challacombe, J. M., et al., *J Immunol* (2006), 177, 8123-8132, activation of vascular endothelium (Hampson, P., et al., *Cancer Immunol Immunother*, (2008), 57, 1241-1251); chemoattraction of neutrophils through induction of interleukin 8 in keratinocytes and development of specific anti-cancer immune responses by CD8+ cells through adjuvant properties in animal models (Le, T. T., et al., *Vaccine*, (2009), 27, 3053-3062).

Compounds exerting dual mode of action by induction of cell death by direct cytotoxicity or induction of apoptosis, and by an immunostimulatory effect involving neutrophil recruit-

2

ment and activation, may be useful for treatment of conditions associated with hyperplasia, neoplasia or dysplasia. Compounds inducing cell death by primary and/or secondary necrosis and compounds exhibiting a pro-apoptotic effect may reduce unwanted cell growth and remove unwanted cells, and furthermore, stimulation of the innate immune response and adjuvant effects may augment the biological response against aberrant or transformed cells.

Compounds inducing cell death by primary and/or secondary necrosis may be useful for treatment of cosmetic conditions, as these compounds may kill or remove unwanted tissue or cells.

There is a continuous need to find new ingenol derivatives which induce cell death by cytotoxicity or apoptosis and/or induce an immunostimulatory effect.

SUMMARY OF THE INVENTION

The present invention provides 3-O-heteroaryl-ingenol derivatives which may for example be useful for treatment of conditions associated with the use of ingenol-3-angelate or useful for treatment of conditions which are affected by induction of cell death by cytotoxicity or induction of apoptosis and/or by an immunostimulatory effect.

Compounds of the present invention stimulate neutrophil oxidative burst, which is part of the innate immune response.

Compounds of the present invention stimulate keratinocyte IL-8 release, thus inducing an immunostimulatory effect.

The term "solvate" is intended to indicate a species formed by interaction between a compound, e.g. a compound of formula I, and a solvent, e.g. alcohol, glycerol or water, wherein said species are in a crystalline form. When water is the solvent, said species is referred to as a hydrate.

The term "substituted" as applied to any moiety herein is intended to indicate substitution with compatible substituents.

The terms "physiological disorders or diseases associated with hyperplasia, neoplasia or dysplasia" in the context of the present invention is intended to cover disorders or diseases such as cutaneous warts, including common warts (*Verruca vulgaris*), plantar warts (*Verruca plantaris*) and flat warts (*verruca plana*); Genital warts (*condyloma acuminatum*), Pyogenic granuloma, Haemangioma, Scleroderma; Cancers and precancerous lesions such as Actinic keratosis, Squamous cell carcinoma including squamous cell carcinoma in situ (Bowen's disease), invasive squamous cell carcinoma, cutaneous squamous cell carcinoma, mucosal squamous cell carcinoma, head and neck squamous cell carcinoma; Basal cell carcinoma including Superficial basal cell carcinoma and

7

Nodular basal cell carcinoma; Bladder cancer, Lentigo maligna, Cervical dysplasia, Vulva dysplasia and anal dysplasia, Primary melanoma in situ, Head and neck cancer, Cutaneous metastases of any cancer, Kaposi's sarcoma, Keratoacanthoma, Merkel cell tumor, Prostate cancer, Mycosis fungoides, Intraepithelial neoplasias including anal, cervical, ductal, oral, perianal, prostatic, penile, vaginal and vulvar intraepithelial neoplasia.

The term "cosmetic indications" in the context of the present invention is intended to cover indications such as: Photodamaged skin, Seborrheic keratosis, Scars, Keloids, Melasma, Poikiloderma of Civatte, Tattoo removal, Naevi and Skin tags.

The term "photodamaged skin" in the context of the present invention is intended to cover fine lines, wrinkles and UV-ageing. UV ageing is often manifested by an increase in the epidermal thickness or epidermal atrophy and most notably by solar elastosis, the accumulation of elastin containing material just below the dermal-epidermal junction. Collagen and elastic fibres become fragmented and disorganised. At a cosmetic level this can be observed as a reddening and/or thickening of the skin resulting a leathery appearance, skin fragility and irregular pigmentation, loss of tone and elasticity, as well as wrinkling, dryness, sunspots and deep furrow formation.

The term "treatment" as used herein means the management and care of a patient for the purpose of combating a disease, disorder or condition. The term is intended to include the delaying of the progression of the disease, disorder or condition, the alleviation, amelioration or relief of symptoms and complications, and/or the cure or elimination of the disease, disorder or condition. The term may also include prevention of the condition, wherein prevention is to be understood as the management and care of a patient for the purpose of combating the disease, condition or disorder and includes the administration of the active compounds to prevent the onset of the symptoms or complications. Nonetheless, prophylactic (preventive) and therapeutic (curative) treatments are two separate aspects.

All references, including publications, patent applications and patents, cited herein are hereby incorporated by reference in their entirety and to the same extent as if each reference were individually and specifically indicated to be incorporated by reference, regardless of any separately provided incorporation of particular documents made elsewhere herein.

wherein X_1 , X_2 , X_3 and X_4 are each independently selected from the group consisting of C, CH, N, NH, S and O; and wherein Y_1 , Y_2 , Y_3 , Y_4 , Y_5 , Y_6 , Y_7 , Y_8 , Y_9 and Y_{10} are each independently selected from the group consisting of C, CH and N.

The compounds of formula I may be obtained in crystalline form either directly by concentration from an organic solvent or by crystallisation or recrystallisation from an organic solvent or mixture of said solvent and a cosolvent that may be organic or inorganic, such as water. The crystals may be isolated in essentially solvent-free form or as a solvate, such as a hydrate. The invention covers all crystalline forms, such as polymorphs and pseudopolymorphs, and also mixtures thereof.

Compounds of formula I may or may not comprise asymmetrically substituted (chiral) carbon atoms which give rise to the existence of isomeric forms, e.g. enantiomers and possibly diastereomers. The present invention relates to all such isomers, either in optically pure form or as mixtures thereof (e.g. racemic mixtures or partially purified optical mixtures). Pure stereoisomeric forms of the compounds and the intermediates of this invention may be obtained by the application of procedures known in the art. The various isomeric forms may be separated by physical separation methods such as selective crystallization and chromatographic techniques, e.g. high pressure liquid chromatography using chiral stationary phases. Enantiomers may be separated from each other by selective crystallization of their diastereomeric salts which may be formed with optically active amines, such as l-ephedrine, or with optically active acids. Optically purified compounds may subsequently be liberated from said purified diastereomeric salts. Enantiomers may also be resolved by the formation of diastereomeric derivatives. Alternatively, enantiomers may be separated by chromatographic techniques using chiral stationary phases. Pure stereoisomeric forms may also be derived from the corresponding pure stereoisomeric forms of the appropriate starting materials, provided that the reaction occur stereoselectively or stereospecifically. Preferably, if a specific stereoisomer is desired, said

compound will be synthesized by stereoselective or stereospecific methods of preparation. These methods will advantageously employ chiral pure starting materials.

Furthermore, when a double bond or a fully or partially saturated ring system is present in the molecule geometric isomers may be formed. It is intended that any geometric isomer, as separated, pure or partially purified geometric isomers or mixtures thereof are included within the scope of the invention.

Compounds of the invention which comprise free hydroxyl groups or free carboxylic acid groups may also exist in the form of pharmaceutically acceptable, physiologically cleavable esters, and are as such included within the scope of the present invention. Such pharmaceutically acceptable esters are preferably prodrug ester derivatives, such being convertible by solvolysis or cleavage under physiologically conditions to the corresponding compounds of the invention which comprise free hydroxyl groups or free carboxylic acid groups respectively, e.g. in-vivo hydrolysable.

Pharmaceutical Compositions of the Invention

For use in therapy, compounds of the present invention are typically in the form of a pharmaceutical composition. The invention therefore relates to a pharmaceutical composition comprising a compound of formula I, together with a pharmaceutically acceptable excipient or vehicle. The excipient

must be "acceptable" in the sense of being compatible with the other ingredients of the composition and not deleterious to the recipient thereof.

Pharmaceutical compositions of the invention may be in unit dosage form such as tablets, pills, capsules, powders, granules, elixirs, syrups, emulsions, ampoules, suppositories or parenteral solutions or suspensions; for oral, parenteral, ophthalmic, transdermal, intra-articular, topical, pulmonary, nasal, buccal, sublingual or rectal administration or in any other manner appropriate for the formulation of compounds of the invention and in accordance with accepted practices such as those disclosed in *Remington: The Science and Practice of Pharmacy*, 21st ed., 2000, Lippincott Williams & Wilkins.

For oral administration in the form of a tablet or capsule, a compound of formula I may suitably be combined with an oral, non-toxic, pharmaceutically acceptable carrier such as ethanol, glycerol, water or the like. Furthermore, suitable binders, lubricants, disintegrating agents, flavouring agents and colourants may be added to the mixture, as appropriate. Suitable binders include, e.g., lactose, glucose, starch, gelatin, *acacia* gum, tragacanth gum, sodium alginate, carboxymethylcellulose, polyethylene glycol, waxes or the like. Lubricants include, e.g., sodium oleate, sodium stearate, magnesium stearate, sodium benzoate, sodium acetate, sodium chloride or the like. Disintegrating agents include, e.g., starch, methyl cellulose, agar, bentonite, xanthan gum or the like. Additional excipients for capsules include macrogols or lipids.

For the preparation of solid compositions such as tablets, the active compound of formula I is mixed with one or more excipients, such as the ones described above, and other pharmaceutical diluents such as water to make a solid preformulation composition containing a homogenous mixture of a compound of formula I. The term "homogenous" is understood to mean that the compound of formula I is dispersed evenly throughout the composition so that the composition may readily be subdivided into equally effective unit dosage forms such as tablets or capsules.

In the form of a dosage unit, the compound may be administered one or more times a day at appropriate intervals, always depending, however, on the condition of the patient, and in accordance with the prescription made by the medical practitioner. Conveniently, a dosage unit of a formulation contain between 0.01 mg and 200 mg, preferably between 0.01 mg and 20 mg, such as 0.01-5 mg of a compound of formula I.

A suitable dosage of the compound of the invention will depend, inter alia, on the age and condition of the patient, the severity of the disease to be treated and other factors well known to the practising physician. The compound may be administered either orally, parenterally or topically according to different dosing schedules, e.g. daily or with weekly intervals. In general a single dose will be in the range from 0.01 to 200 mg/kg body weight. The compound may be administered as a bolus (i.e. the entire daily dose is administered at once) or in divided doses two or more times a day.

If the treatment involves administration of another therapeutically active compound it is recommended to consult *Goodman & Gilman's The Pharmacological Basis of Therapeutics*, 9th Ed., J. G. Hardman and L. E. Limbird (Eds.), McGraw-Hill 1995, for useful dosages of said compounds. The administration of a compound of the present invention with one or more other active compounds may be either concomitantly or sequentially.

Liquid formulations for either oral or parenteral administration of the compound of the invention include, e.g., aque-

ous solutions, syrups, aqueous or oil suspensions and emulsion with edible oils such as cottonseed oil, sesame oil, coconut oil or peanut oil. Suitable dispersing or suspending agents for aqueous suspensions include synthetic or natural gums such as tragacanth, alginate, *acacia*, dextran, sodium carboxymethylcellulose, gelatin, methylcellulose or polyvinylpyrrolidone.

For parenteral administration, e.g. intramuscular, intraperitoneal, subcutaneous or intravenous injection or infusion, the pharmaceutical composition preferably comprises a compound of formula I dissolved or solubilised in an appropriate, pharmaceutically acceptable solvent. For parenteral administration, the composition of the invention may include a sterile aqueous or non-aqueous solvent, in particular water, isotonic saline, isotonic glucose solution, buffer solution or other solvent conventionally used for parenteral administration of therapeutically active substances. The composition may be sterilised by, for instance, filtration through a bacteria-retaining filter, addition of a sterilising agent to the composition, irradiation of the composition, or heating the composition. Alternatively, the compound of the invention may be provided as a sterile, solid preparation, e.g. a freeze-dried powder, which is dissolved in sterile solvent immediately prior to use. The composition intended for parenteral administration may additionally comprise conventional additives such as stabilisers, buffers or preservatives, e.g. antioxidants such as methyl hydroxybenzoate or the like.

Compositions for rectal administration may be in the form of a suppository incorporating the active ingredient and a carrier such as cocoa butter, or in the form of an enema. Compositions suitable for intra-articular administration may be in the form of a sterile aqueous preparation of the active ingredient which may be in microcrystalline form, for example, in the form of an aqueous microcrystalline suspension. Liposomal formulations or biodegradable polymer systems may also be used to present the active ingredient for both intra-articular and ophthalmic administration.

Compositions suitable for topical administration, including ophthalmic treatment, include liquid or semi-liquid preparations such as liniments, lotions, gels, applicants, oil-in-water or water-in-oil emulsions such as creams, ointments or pastes; or solutions or suspensions such as drops. Compositions for ophthalmic treatment may preferably additionally contain a cyclodextrin. Compositions suitable for administration to the nasal or buccal cavity or for inhalation include powder, self-propelling and spray formulations, such as aerosols and atomizers.

Human skin, in particular the outer layer, the stratum corneum, provides an effective barrier against penetration of microbial pathogens and toxic chemicals. While this property of skin is generally beneficial, it complicates the dermal administration of pharmaceuticals in that a large quantity, if not most, of the active ingredient applied on the skin of a patient suffering from a dermal disease may not penetrate into the viable layers of the skin where it exerts its activity.

Penetration of the skin is facilitated by addition of penetration enhancers which include isopropyl alcohol, sulphoxides, azones, pyrrolidines, alkanols, and glycols. In embodiments of the invention the penetrations enhancers includes DMSO, laurocapram, 2-pyrrolidone, decanol and propylene glycol. In an embodiment of the invention the penetration enhancer is isopropyl alcohol.

In embodiments of the invention the therapeutically active compound is dissolved in a suitable solvent. Suitable solvents are glycols, ketone, acetates and ethers. Ingenol compounds have been shown to have good stability in alcohols such as benzyl alcohol and isopropyl alcohol. In general, ingenol

compounds have previously shown to have good stability at low pH. In embodiments of the present invention the pH of the pharmaceutical formulation is below 7. In embodiments of the present invention the pH of the pharmaceutical formulation is below 6. In embodiments of the present invention the pH of the pharmaceutical formulation is below 4.5. In embodiments of the present invention the pH of the pharmaceutical formulation is below 4.0. In embodiments of the present invention the pH of the pharmaceutical formulation is below 4.5 and no less than 2.5. In embodiments of the present invention the pH of the pharmaceutical formulation is below 4.0 and no less than 2.5. The preferred pH range can be obtained by including an appropriate buffer. In an embodiment of the invention the buffer is an acetate buffer. In embodiments of the invention a citrate buffer is used. In embodiments of the invention a mixed citrate-phosphate buffer is used.

In one embodiment, the composition is an ointment. According to the current FDA classification, an ointment is a semisolid dosage form which may contain water and volatile substances in an amount of up to 20% by weight and which contains more than 50% by weight of hydrocarbons, waxes or polyols in the vehicle. Thus, according to the invention, the ointment may be a water-in-oil composition in which case the nanosuspension may be added as such to the lipophilic components of the composition, such that the composition contains up to 10% by weight or, preferably, up to 5% by weight of the aqueous phase. Alternatively, the composition may be a non-aqueous ointment which contains less than about 2%, preferably less than 1%, of free water by weight of the composition.

The ointment carrier may suitably contain a paraffin selected from paraffins consisting of hydrocarbons with chain lengths from C₅₋₆₀ and mixtures thereof. A frequently used ointment carrier is petrolatum, or white soft paraffin, which is composed of hydrocarbons of different chain lengths, peaking at about C₄₀₋₄₄, or a mixture of petrolatum and liquid paraffin (consisting of hydrocarbons of different chain lengths peaking at C₂₈₋₄₀). While petrolatum provides occlusion of the treated skin surface, reducing transdermal loss of water and potentiating the therapeutic effect of the active ingredient in the composition, it tends to have a greasy and/or tacky feel which persists for quite some time after application, and it is not easily spreadable. It may therefore be preferred to employ paraffins consisting of hydrocarbons of a somewhat lower chain length, such as paraffins consisting of hydrocarbons with chain lengths peaking at C₁₄₋₁₆, C₁₈₋₂₂, C₂₀₋₂₂, C₂₀₋₂₆ or mixtures thereof. It has been found that such paraffins are more cosmetically acceptable in that they are less tacky and/or greasy on application and more easily spreadable. They are therefore expected to result in improved patient compliance. Suitable paraffins of this type are manufactured by Sonneborn and marketed under the trade name Sonnecone, e.g. Sonnecone CM, Sonnecone DM1, Sonnecone DM2 and Sonnecone HV. These paraffins are further disclosed and characterized in WO08/141078 which is incorporated herein by reference. (The hydrocarbon composition of the paraffins has been determined by gas chromatography.)

To impart a desired viscosity to the composition, it may suitably include a lipophilic viscosity-increasing ingredient such as a wax. The wax may be a mineral wax composed of a mixture of high molecular weight hydrocarbons, e.g. saturated C₃₅₋₂₀ alkanes, such as microcrystalline wax. Alternatively, the wax may be a vegetable or animal wax, e.g. esters of C₁₄₋₃₂ fatty acids and C₁₄₋₃₂ fatty alcohols, such as beeswax. The amount of viscosity-increasing ingredient may vary according to the viscosifying power of the ingredient, but may

typically be in the range of about 1-20% by weight of the composition. When the viscosity-increasing ingredient is microcrystalline wax it is typically present in an amount in the range of about 5-15% by weight, e.g. about 10% by weight, of the composition.

To maintain good physical stability of the composition, in particular to avoid separation of the aqueous and lipid phases therein, it may be advantageous to include a water-in-oil emulsifier with an HLB value of 3-8. Examples of such emulsifiers are polyoxyethylene C₈₋₂₂ alkyl ethers, e.g. polyoxyethylene stearyl ether, polyoxyethylene cetyl ether, polyoxyethylene oleyl ether or polyoxyethylene lauryl ether. The amount of emulsifier is typically in the range of 2-10% w/w of the composition.

In another embodiment, the composition is a cream which may comprise similar components to the ointment, but which is typically an oil-in-water-emulsion containing a substantial amount of water.

The composition may also comprise other components commonly used in dermal formulations, e.g. antioxidants (e.g. alpha-tocopherol), preservatives such as benzyl alcohol, sodium edetate, pigments, skin soothing agents, skin healing agents and skin conditioning agents such as urea, allantoin or bisabolol, cf. *CITFA Cosmetic Ingredients Handbook*, 2nd Ed., 1992. In an embodiment of the invention the preservative is benzyl alcohol.

In an embodiment the composition is a gel. Suitable gelling agents include, water soluble cellulose derived polymers, such as hydroxyalkyl cellulose polymers. Methods of Preparation

The compounds of formula I may for example be prepared using the reactions and techniques outlined below together with methods known in the art of synthetic organic chemistry, or variations thereof as appreciated by those skilled in the art. Preferred methods include, but are not limited to, those described below. The reactions are carried out in solvents appropriate to the reagents and materials employed and suitable for the transformations being effected. Also, in the synthetic methods described below, it is to be understood that all proposed reaction conditions, including choice of solvent,

29

reaction atmosphere, reaction temperature, duration of experiment and work-up procedures, are chosen to be conditions of standard for that reaction, which should be readily recognized by one skilled in the art. Not all compounds falling into a given class may be compatible with some of the reaction conditions required in some of the methods described. Such restrictions to the substituents which are compatible with the reaction conditions will be readily apparent to one skilled in the art and alternative methods can be used. The compounds of the present invention or any intermediate may be purified if required using standard methods well known to a synthetic organic chemist, e.g. methods described in W. Armarego "Purification of Laboratory Chemicals", Butterworth-Heinemann, 6th ed. 2009. Starting materials are either known compounds, commercially available, or they may be prepared by routine synthetic methods well known to a person skilled in the art.

The compounds of the invention may for example be prepared according to the following non-limiting general methods and examples.

The compounds of the general formula I can for example be synthesised according to Scheme 1 or 2 by reacting ingenol with a hydroxyl protecting agent or a dihydroxyl protecting agent to afford the protected ingenol derivatives a or c according to methods described in, but not limited to "Protective Groups in Organic Synthesis", 4th ed. P. G. M. Wuts; T. W. Greene, John Wiley, 2007 or in P. J. Kocienski, "Protecting Groups", 3rd ed. G. Thieme, 2003 and references cited therein.

For example compound a, wherein the protective group (Pg) is triphenylmethyl, can be synthesised by reacting ingenol with a triphenylmethyl reagent such as triphenylmethylpyridinium fluoroborate or triphenylmethyl chloride in a suitable solvent such as pyridine, N,N-dimethylformamide or dichloromethane in the presence or in the absence of base (e.g. Opferkuch et. al., Z. Naturforschung, (1981), 36B, 878). Compound a, wherein the protective group (Pg) is silyl, can for example be synthesised by reacting ingenol with a silyl chloride such as tert-butyldimethylsilyl chloride, tert-butyl-diphenylsilyl chloride or triisopropylsilyl chloride in a suitable solvent such as N,N-dimethylformamide, pyridine, dichloromethane, tetrahydrofuran or acetonitrile in the presence of a suitable base such as imidazole, triethylamine, N,N-diisopropylethylamine or 4-(N,N-dimethylamino)pyridine (e.g. Sorg, B. et. al. Z. Naturforsch., (1982), 37B, 1640-47), or by reacting ingenol with a silyl triflate such as tert-butyldimethylsilyl trifluoromethanesulfonate in a suitable solvent such as dichloromethane in the presence of a suitable base such as triethylamine.

Compound a wherein Pg is 2-tetrahydropyranyl, can for example be synthesised by reacting ingenol with dihydropyran in a suitable solvent such as dichloromethane or acetonitrile in the presence of a suitable acid such as p-toluenesulfonic acid.

Compound c wherein the protective group (Pg) represents an acetal such as benzylidene acetal can for example be prepared by reacting ingenol with benzaldehyde or benzaldehyde dimethyl acetal in a suitable solvent such as dichloromethane or N,N-dimethylformamide in the presence of a suitable acid such as p-toluenesulfonic acid. Compound c wherein the protective group (Pg) represents a ketal such as isopropylidene ketal can for example be synthesised by reacting ingenol with a ketone such as acetone or a dimethoxy ketal such as 2,2-dimethoxy propane in a suitable solvent such as dichloromethane or N,N-dimethylformamide in the presence of a suitable acid such as p-toluenesulfonic acid (e.g. B. Sorg, Z. Naturforsch. (1982), 37b, 748-756). Acetone and 2,2-dimethoxy propane can also act as solvents.

As depicted in scheme 1 and 2 the protected ingenol derivatives a or c may be reacted to give compounds of the general formula b or d according to methods frequently described in the literature (e.g. Saari, R. et al. Bioorg. Med. Chem. (2011), 19, 935-950; Lloung, M. et al. Heterocycles (2004), 63, 297-

32

308; Lin, N.-H. et al. Bioorg. Med. Chem. Lett. (1999), 9, 2747-2752; Fukuwa, I. et al. J. Chem. Soc., Perkin Trans. 2 (1992), 377-382; Uray, G. Synthesis 1984, 679-681; Gerrity K. et al. J. Med. Chem. (1978), 21, 123-126). 2-Halo-heteroaromatic compounds for example react with alcohols in the presence of a base, such as alkali (Na, K, Cs) carbonates, caesium fluoride, potassium tert-butoxide, sodium hydroxide, potassium hydroxide and sodium hydride, in solvents, such as acetonitrile, t-BuOH, THF, 1,4-dioxane, DMSO and DMF, to give 2-heteroaryl ethers. 2-Fluoro-heteroaromatic compounds react with the corresponding alcohols more readily than the corresponding chloro- or bromo-compounds. If they are not reactive enough, 2-chloro- or bromo-compounds can be converted to the corresponding 2-fluoro-heteroaryl compounds (e.g. Ahmadi, A. Asian J. Chem. (2009), 9, 6651-6655) and the reaction mixtures can be used directly in the next step without isolation of 2-fluoro-heteroaryl compounds.

Compounds of general formulae b and d can e.g. be prepared by the copper(I) catalysed reactions of haloheteroaryl compounds with compounds of general formulae a and c (for this type reaction, see: Stocking, E. M. et al. Bioorg. Med. Chem. (2010), 20, 2755-2760; Benaskar, F. et al. Tetrahedron Lett. (2010), 248-251; Altman, R. A. J. Org. Chem. (2008), 73, 284-286; Keegstra, M. A. Tetrahedron (1992), 3633-3652. For a review, see: Evano, G. Chem. Rev. (2008), 108, 3054-3131). Compounds of general formulae b and d can e.g. be prepared by the Pd-catalysed reactions of haloheteroaryl compounds with compounds of general formulae a and c (for this type reaction, see: Vorogushin, A. V. et al. J. Am. Chem. Soc. (2005), 127, 8146-8149).

The compounds of formula I may be prepared by selective removal of the protective groups Pg from the compounds of the general structure b or d according to methods for deprotection of hydroxyl or dihydroxyl protective groups described, in but not limited to "Protective Groups in Organic Synthesis", 4th ed. P. G. M. Wuts; T. W. Greene, John Wiley, 2007 or in P. J. Kocienski, "Protecting Groups", 3rd ed. G. Thieme, 2003 and references cited therein.

Compounds of general formula I can for example be prepared from compounds of general formula d wherein Pg represents an acetal such as benzylidene acetal or a ketal such as an isopropylidene ketal by cleavage of the protecting group in the presence of a suitable acid such as aqueous hydrogen chloride, acetic acid, trifluoroacetic acid or p-toluenesulfonic acid in a suitable solvent such as methanol or aqueous tetrahydrofuran. Compounds of general formula I can for example be prepared from compounds of general formula b wherein Pg represents an alkoxyalkyl such as 2-tetrahydropyranyl by cleaving the acetal moiety, for example by acid catalysed cleavage in the presence of a suitable acid such as p-toluenesulfonic acid in a suitable solvent such as methanol. Compounds of general formula I can for example be prepared from compounds of general formula b wherein Pg represents silyl such as tert-butyldimethylsilyl by reacting compound b with a suitable acid such as hydrogen chloride in a suitable solvent such as methanol or by reacting with a fluoride source such as tetra n-butylammonium fluoride or tetrafluorosilane in a suitable solvent such as tetrahydrofuran or acetonitrile. Compounds of general formula I can for example be prepared from compounds of general formula b wherein Pg represents triphenylmethyl by reacting compound b with a suitable acid such as formic acid or trifluoroacetic acid in a suitable solvent such as ether, methanol or dichloromethane.

PREPARATIONS AND EXAMPLES

Ingenol-5,20-acetonide

Ingenol (1.00 g, 2.30 mmol) was dissolved in a solution of p-toluenesulphonic acid monohydrate in acetone (0.47 mg/mL, 22.5 mL). The solution was stirred at room temperature for 25 min. To this solution was added a saturated aqueous solution of NaHCO_3 (0.2 mL). The obtained mixture was concentrated in vacuo. The residue was taken up in brine and extracted with ethyl acetate. The combined organic phases were dried over sodium sulfate and concentrated in vacuo. The residue was purified by flash chromatography (heptane/ethyl acetate 19:1 heptane/ethyl acetate 0:1), giving the title compound as a white solid (616 mg, 69%). (See also: Opferkuch, H. J. et. al., *Z. Naturforsch.*, (1981), 86b, 878-887.)

General Procedures for the Preparation of Compounds of General Formula II

Procedure a

Ingenol-5,20-acetonide (0.13 mmol) dissolved in DMF (0.3 ml) was added a heteroaryl halide (0.65 mmol) and caesium carbonate (0.26 mmol). The mixture was stirred at 60°C . for 1 hour. After cooling to r.t. the mixture was partitioned between diethylether (2 ml) and saturated aq. sodium hydrogencarbonate (0.5 ml). The ether phase was isolated, dried over sodium sulphate and concentrated in vacuo. The residue was purified by flash chromatography (heptane \rightarrow heptane/ethyl acetate 7:3), giving the title compound as a white solid.

Procedure b

A mixture of CuI (0.1 eq), 3,4,7,8-tetramethyl-1,10-phenanthroline (0.2 eq), heteroaryl halide (1.5 eq), caesium carbonate (1.5 eq), ingenol-5,20-acetonide (1 eq) and toluene was stirred in a closed vessel in an argon atmosphere at 80°C . until LC-MS of the crude reaction mixture showed that the ingenol-5,20-acetonide was consumed. The reaction mixture was

a) cooled to room temperature and filtered, toluene was removed in vacuo and the crude product was purified by HPLC (Eluent: acetonitrile/50 mM ammonium hydrogencarbonate 7:3 \rightarrow acetonitrile)

or

b) cooled to room temperature and diluted with EtOAc and water. The organic layer was washed twice with water. The organic layer was dried over MgSO_4 and solvent removed in vacuo. The crude product was purified on flash chromatography (Silica gel) and eluted with 100% heptane \rightarrow heptane/ethyl acetate 4:6.

Procedure c

A mixture of dry CsF (25-35 eq), heteroaryl chloride (3-5 eq) and dry DMSO was stirred in a closed vessel in an argon atmosphere at $130-140^\circ\text{C}$. and stirred until LC-MS of the crude reaction mixture indicated that approx. 50% of Cl was replaced with F. The reaction was cooled to room temperature and ingenol-5,20-acetonide was added. The reaction was stirred at room temperature until LC-MS of the crude reaction mixture showed that ingenol-5,20-acetonide was consumed.

The reaction mixture was diluted with diethylether and water. The organic layer was further washed three times with water. The organic layer was dried over sodium sulfate, fil-

35

tered and solvent was removed in vacuo. The crude product was purified by flash chromatography as described in procedure b.

General Procedure for the Preparation of Compounds of General Formula I

Procedure d

3-O-Heteroaryl-ingenol-5,20-acetonide (a compound of formula II) (0.10 mmol) was dissolved in tetrahydrofuran (0.47 mL) under argon. An aqueous solution of HCl (4 M, 4.7 μ L) was added. The solution was stirred at room temperature for 20-27 h. Tetrahydrofuran may be replaced with methanol and the reaction time at room temperature shortened to 0.5 h. The solution was concentrated in vacuo. The residue was purified by flash chromatography (heptane/ethyl acetate 5:1 \rightarrow heptane/ethyl acetate 3:7), giving the title compound. For more polar compounds a dichloromethane/methanol 98:2 \rightarrow dichloromethane/methanol 95:5 gradient was used.

Procedure e

Caesium carbonate (1.5 eq) and an alkyl halide (1.2 eq) was added, and the reaction was stirred at room temperature until 2-iodo-1H-imidazole was consumed. The mixture was diluted with diethylether and washed three times with water. The ether phase was dried over sodium sulphate and concentrated in vacuo. The product was used without further purification.

Example 1

Neutrophil Oxidative Burst

PMN's (polymorphonuclear leukocytes) are isolated and purified from fresh buffy coats by sequential sedimentation, density centrifugation and lysis of contaminating erythrocytes. In brief, buffy coats are incubated with 2% methocel for 30-45 min to differentially sediment red blood cells. The leukocyte-rich supernatant is transferred to lymphoprep tubes to remove mononuclear cells by density centrifugation (400×g, 30 min). The pellet is resuspended and any remaining erythrocytes lysed using 0.2% NaCl for 30 sec before restoring isotonicity by the addition of 1.2% NaCl. This step is repeated until the cell pellet appears relatively free of red blood cells. Cells are resuspended in DPBS (Dulbecco's Phosphate Buffered Saline) (w.o. Ca²⁺, Mg²⁺) and the concentration adjusted to 1.4×10⁶ cells/ml in HBSS (Hanks Balanced Salt solution) (w Ca²⁺, Mg²⁺) containing 0.1% BSA (Bovine Serum Albumin) and 5 mM glucose just prior to assay initiation. Titrated reference and test compounds are pre-mixed with HE (Hydroethidine) (10 μM final assay concentration) before addition to 96-well plates containing 2.5×10⁵ cells. Following 40 min incubation at rt, changes in the respiratory burst is estimated by measuring fluorescence at 579 nm (excitation: 485 nm) using an Envision plate reader.

Test compound titration curves are fitted to a four-parameter sigmoidal curve after normalizing the effect of the test compound to the effect of the positive control (5×10⁻⁷ M PEP0005). Rel EC₅₀ denotes the concentration of test compound producing an effect that is midway between the fitted top and bottom. Abs EC₅₀ is the concentration of test compound that provokes a response corresponding to 50% of the maximal effect associated with the positive control (5×10⁻⁷ M PEP0005).

Example 2

HeKa Cytokine Release (IL-8)

Primary human epidermal keratinocytes, HeKa, are seeded (10,000 cells/well) in 96-well plates the day before the assay. Test compounds are diluted in DMSO (dimethyl sulfoxide) and further diluted in assay medium and pipetted into wells of 96 well-plates containing HeKa cells. The plates are incubated for 6 h at 37° C. in humidified air with 5% CO₂. Plates are centrifuged briefly to spin down cells at 4° C., the supernatant is removed and analysed by Meso Scale Discovery (MSD) 4-spot cytokine assay (Pro-inflammatory II Ultra Sensitive kit, MSD, MD, USA). The MSD assay employs a sandwich immunoassay format where capture antibodies are coated in a patterned array on the bottom of the wells of a 4-Spot-Multi-MSD plate. Standard samples are incubated in the MULTI-SPOT plates as well, and the cytokine (IL-8) binds to its corresponding capture antibody spot. The cytokine level is quantitated on a SECTOR™ Imager using a cytokine-specific Detection Antibody labelled with MSD SULFO-TAG™ reagent.

Test compound titration curves are fitted to a four-parameter sigmoidal curve after normalizing the effect of the test compound to the effect of the positive control (1.5×10⁻⁷ M PEP0005). Rel EC₅₀ denotes the concentration of test compound producing an effect that is midway between the fitted top and bottom. Abs EC₅₀ is the concentration of test compound that provokes a response corresponding to 50% of the maximal effect associated with the positive control (1.5×10⁻⁷ M PEP0005).

Example 3

Necrosis Assay

HeLa cells (ATCC CCL-002) were grown in minimal essential medium (Invitrogen catalog no. 42360) containing 10% fetal bovine serum, 100 IU/ml penicillin and 100 μg/ml streptomycin. 4,000-6,000 cells were seeded into 96-well black ViewPlates-plates, clear bottom, (Perkin Elmer) in 100 μl medium and incubated overnight. Compounds were dissolved and pre-diluted in DMSO in 96-well polypropylene plates (Greiner) in a concentration range of 15 μM to 600 μM. At the time of the experiment cell plates were placed on heating blocks at 37° C., medium was removed and 40 μl fresh, pre-warmed medium was added per well. Cells were incubated for 15 min before addition of compounds. In parallel, 3 μl of compounds were diluted with 197 μl growth medium on a Tecan freedom-EVO pipetting station using 250 μl/s pipetting speed, in order to ensure effective mixing of the highly concentrated compound solutions with the aqueous phase.

These pre-dilution plates were then equilibrated on heating blocks at 37° C. for 10 min. 80 μl pre-diluted compound were transferred manually to the corresponding wells containing HeLa cells yielding compound concentrations of 10 μM to 400 μM. Control conditions were 1% DMSO in growth medium (100% viability) and 400 μM ingenol mebutate in growth medium (0% viability). Plates were incubated on the heating blocks at 37° C. for 30 min. At the end of the incubation 10 μl PrestoBlue reagent (Invitrogen) were added to each well, plates were sealed with black seal, followed by incubation at 37° C. for 10 min with gentle shaking (150 rpm). Subsequently, plates were placed at room temperature for 20-30 min. Plates were read immediately after on an Envision Fluorescence reader (Perkin Elmer) with excitation at 535 nm

and emission at 630 nm. Test compound titration curves were fitted to a four-parameter sigmoidal curve after normalizing the effect of the test compound to the effect of the positive control (4 10^{-4} M PEP0005/ingenol mebutate). Abs EC₅₀ denotes the concentration of test compound producing 50% effect.
